Async / Await

we use async keyword to declare or define the async function

* async fun always returns

Promise

→ `Promise.resolve` always returns the fulfilled promise - object

→ `Promise.reject` always returns the rejected promise object

await → it's for how you consume the promise object

or it eleminates the promise chain

await can only be used inside async function

await ka mtlb hai wait karo

and await async code ko handle krta hai like .then()

await → Pausing without blocking

```
async function fun3() {
    return "hello"
}

function fun4() {
    return Promise.resolve("hiiii")
}
console.log("1");
async function fun5() {

    // fun3().then(data => {
    //     console.log(data);
    // })

    console.log("2");
    let data = await fun3()
    console.log("3");
    let data2 = await fun4()
    console.log("4");
    console.log(data,data2);
}

console.log("nishant");

fun5()

console.log("5");
```

output

1

nishant

2

5

3

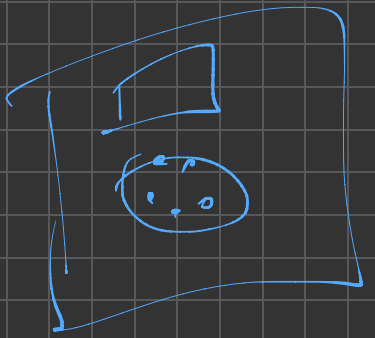

4

try catch block

```
try {
    → code ko try karo
} catch( ) {
    → error ko catch karo
}
```

finally {

stop loader()

```
function searchPizza() {
    return new Promise(function (resolve, reject) {
        console.log("Pizza searching...");
        setTimeout(function fun1() {
            console.log("Here is the Pizza's Menu.");
            let price = 500;
            // a(price)
            resolve(price)
        }, 2000)
    })
}
```

3

```
function searchPizza() {
    return new Promise(function (resolve, reject) {
        console.log("Pizza searching...");
        setTimeout(function fun1() {
            console.log("Here is the Pizza's Menu.");
            let price = 500;
            // a(price)
            resolve(price)
        }, 2000)
    })
}
```

```
async function orderFood() {
    try {
        let price = await searchPizza()
        await addToCart()
        await paymet(price)
        console.log("Bss Aa hee gaya Pizza");
    } catch (error) {
        console.log(error);
    }
}

orderFood()
```

Promise Methods

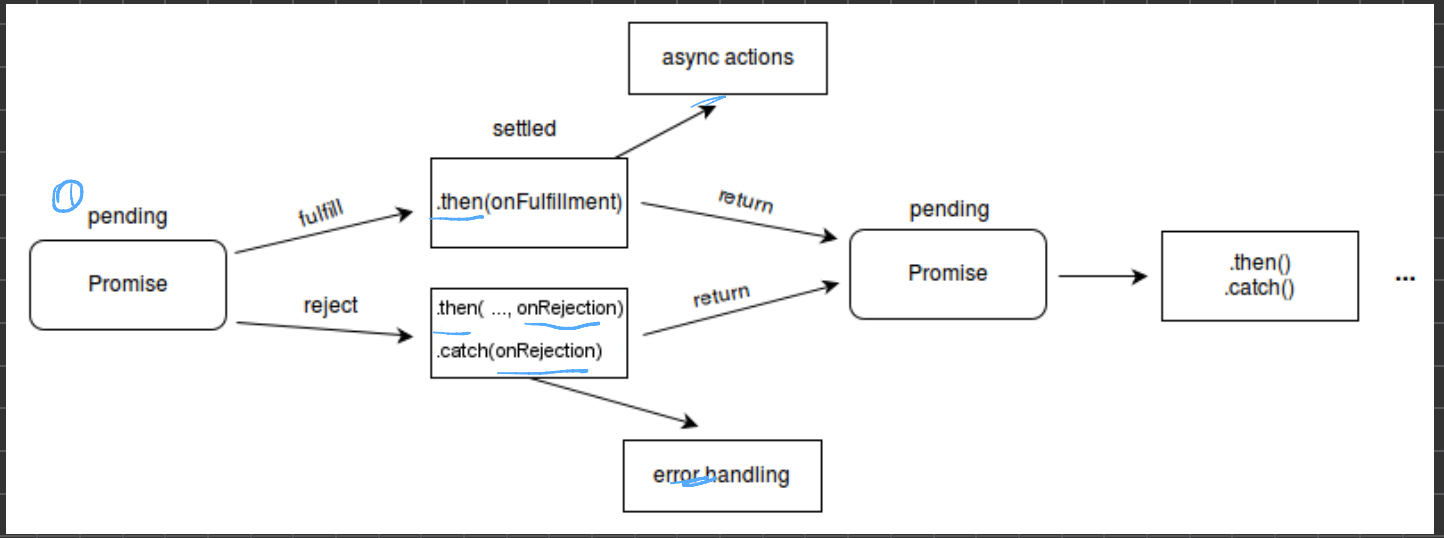

- Resolve
- Reject

1. .all()
2. .allSettled()
3. .race()
4. .any()

sare methods array of promises lete hai

.all() → All promises are fulfilled the output same sequence mai hoga in array.

if koi promise reject hua toh output reject hoga.

async actions
settled
pending
Promise
fulfill
.then(onFulfillment)
return
pending
Promise
.then()
.catch()
...
reject
.then(..., onRejection)
.catch(onRejection)
return
error handling
